These units were written to build upon concepts from prior units, so later units contain tasks that depend upon the concepts addressed in earlier units. All units will include the Mathematical Practices and indicate skills to maintain.

Grades 6-8 Key:
NS = The Number System
NS $=$ The Num
$\mathbf{F}=$ Functions
$\mathbf{E E}=$ Expressions and Equations
G = Geometry
$\mathbf{S P}=$ Statistics and Probability.

## Georgia Department of Education

## Georgia Standards of Excellence Eighth Grade Mathematics Curriculum Map Rationale

Unit 1: This unit centers around geometry standards related to transformations both on and off the coordinate plane - translations, reflections, rotations, and dilations. Students develop understanding of congruence and similarity using physical models, transparencies, or geometry software, and learn to use informal arguments to establish proof of angle sum and exterior angle relationships.

Unit 2: Students explore and understand numbers that are not rational (irrational numbers) and approximate their value by using rational numbers. Students work with radicals and express very large and very small numbers using integer exponents.

Unit 3: Students extend their work with irrational numbers by applying the Pythagorean Theorem to situations involving right triangles, including finding distance, and will investigate proofs of the Pythagorean Theorem and its converse. Students solve real-world problems involving volume of cylinders, cones, and spheres.

Unit 4: Students are introduced to relations and functions. Students define, evaluate, and compare functions. Functions are described and modeled using a variety of depictions, including algebraic representation, graphic representation, numerical tables, and verbal descriptions.

Unit 5: Students further explore functions, focusing on the study of linear functions. Students develop understanding of the connections between proportional relationships, lines, and linear equations, and solve mathematical and real-life problems involving such relationships. Slope is formally introduced, and students work with equations for slope in different forms, including comparing proportional relationships depicted in different ways (graphical, tabular, algebraic, verbal).

Unit 6: Students extend the study of linear relationships by exploring models and tables to describe rate of change. The study of statistics expands to bivariate data, which can be graphed and a line of best fit determined.

Unit 7: The final unit broadens the study of linear equations to include situations involving simultaneous equations. Using graphing, substitution, and elimination, students learn to solve systems of equations algebraically, and make applications to real-world situations.

| Standards for Mathematical Practice |  |  |  |
| :---: | :---: | :---: | :---: |
| 1 Make sense of problems and persevere in solving them. 2 Reason abstractly and quantitatively. <br> 3 Construct viable arguments and critique the reasoning of others. <br> 4 Model with mathematics. |  | 5 Use appropriate tools strategically. <br> 6 Attend to precision. <br> 7 Look for and make use of structure. <br> 8 Look for and express regularity in repeated reasoning. |  |
| Unit 1 | Unit 2 | Unit 3 | Unit 4 |
| Transformations, Congruence and Similarity | Exponents | Geometric Applications of Exponents | Functions |
| Understand congruence and similarity using physical models, transparencies, or geometry software. <br> MGSE8.G. 1 Verify experimentally the congruence properties of rotations, reflections, and translations: lines are taken to lines and line segments to line segments of the same length; angles are taken to angles of the same measure; parallel lines are taken to parallel lines. <br> MGSE8.G. 2 Understand that a twodimensional figure is congruent to another if the second can be obtained from the first by a sequence of rotations, reflections, and translations; given two congruent figures, describe a sequence that exhibits the congruence between them. <br> MGSE8.G. 3 Describe the effect of dilations, translations, rotations and reflections on twodimensional figures using coordinates. <br> MGSE8.G. 4 Understand that a twodimensional figure is similar to another if the second can be obtained from the first by a sequence of rotations, reflections, translations, and dilations; given two similar two- dimensional figures, describe a sequence that exhibits the similarity between them. <br> MGSE8.G. 5 Use informal arguments to establish facts about the angle sum and exterior angle of triangles, about the angles created when parallel lines are cut by a transversal, and the angle-angle criterion for similarity of triangles. | Work with radicals and integer exponents. MGSE8.EE. 1 Know and apply the properties of integer exponents to generate equivalent numerical expressions. <br> MGSE8.EE. 2 Use square root and cube root symbols to represent solutions to equations. Recognize that $\mathrm{x}^{2}=\mathrm{p}$ (where p is a positive rational number and $1 \mathrm{xl}<25$ ) has 2 solutions and $\mathrm{x}^{3}=\mathrm{p}$ (where p is a negative or positive rational number and $1 \mathrm{xl}<10$ ) has one solution. Evaluate square roots of perfect squares < 625 and cube roots of perfect cubes >-1000 and < 1000 . <br> MGSE8.EE. 3 Use numbers expressed in scientific notation to estimate very large or very small quantities, and to express how many times as much one is than the other. For example, estimate the population of the United States as $3 \times 108$ and the population of the world as $7 \times 109$, and determine that the world population is more than 20 times larger. <br> MGSE8.EE. 4 Add, subtract, multiply and divide numbers expressed in scientific notation, including problems where both decimal and scientific notation are used. Understand scientific notation and choose units of appropriate size for measurements of very large or very small quantities (e.g. use millimeters per year for seafloor spreading). Interpret scientific notation that has been generated by technology (e.g. calculators). | Understand and apply the Pythagorean Theorem. <br> MGSE8.G. 6 Explain a proof of the Pythagorean Theorem and its converse. MGSE8.G. 7 Apply the Pythagorean Theorem to determine unknown side lengths in right triangles in real-world and mathematical problems in two and three dimensions. <br> MGSE8.G. 8 Apply the Pythagorean Theorem to find the distance between two points in a coordinate system. <br> Solve real-world and mathematical problems involving volume of cylinders, cones, and spheres. <br> MGSE8.G. 9 Apply the formulas for the volume of cones, cylinders, and spheres and use them to solve real-world and mathematical problems. <br> Work with radicals and integer exponents. MGSE8.EE. 2 Use square root and cube root symbols to represent solutions to equations. Recognize that $\mathrm{x}^{2}=\mathrm{p}$ (where p is a positive rational number and $1 \mathrm{xl}<25$ ) has 2 solutions and $x^{3}=p$ (where $p$ is a negative or positive rational number and $1 \mathrm{xl}<10$ ) has one solution. Evaluate square roots of perfect squares < 625 and cube roots of perfect cubes >-1000 and < 1000 . | Define, evaluate, and compare functions. MGSE8.F. 1 Understand that a function is a rule that assigns to each input exactly one output. The graph of a function is the set of ordered pairs consisting of an input and the corresponding output. <br> MGSE8.F. 2 Compare properties of two functions each represented in a different way (algebraically, graphically, numerically in tables, or by verbal descriptions). |

## Georgia Department of Education

| Analyze and solve linear equations and pairs of simultaneous linear equations. MGSE8.EE. 7 Solve linear equations in one variable. <br> MGSE8.EE.7a Give examples of linear equations in one variable with one solution, infinitely many solutions, or no solutions. Show which of these possibilities is the case by successively transforming the given equation into simpler forms, until an equivalent equation of the form $x=a, a=a$, or $\mathrm{a}=\mathrm{b}$ results (where a and b are different numbers). <br> MGSE8.EE.7b Solve linear equations with rational number coefficients, including equations whose solutions require expanding expressions using the distributive property and collecting like terms. <br> Know that there are numbers that are not rational, and approximate them by rational numbers. <br> MGSE8.NS. 1 Know that numbers that are not rational are called irrational. Understand informally that every number has a decimal expansion; for rational numbers show that the decimal expansion repeats eventually, and convert a decimal expansion which repeats eventually into a rational number. MGSE8.NS. 2 Use rational approximation of irrational numbers to compare the size of irrational numbers, locate them approximately on a number line, and estimate the value of expressions (e.g., estimate $\pi^{2}$ to the nearest tenth). For example, by truncating the decimal expansion of $\sqrt{ } 2$ (square root of 2 ), show that $\sqrt{ } 2$ is between 1 and 2 , then between 1.4 and 1.5, and explain how to continue on to get better approximations. |  |  |
